William Quintal

I believe that ads b out should be installed in all aircraft that fly VFR in all airspace as it has the potential to increase safety and reduce mid air flight risk.

However to the high costs involved in both purchasing and labour to install these devices the current grant that is available should be for 50% of the cost not just a token figure (\$5000) I have recently installed a ads b in/out unit and the cost was in the order of \$30k and as you can see most operators will not be willing to spend that amount of money.
