Abstract

This report is second in a series examining young versus older driver differences in car crashes for both Australian and USA data. Bivariate analyses examining the similarities and differences between drivers of various age groups involved in reported severe casualty crashes for South Australia (1986 to 1990) were conducted. Results are discussed and accompanied by a series of tables. The data was also examined for day and night-time differences. Conclusions and comparisons between the two data sets are not presented as the 11th report of the series provides an overview of all findings.

Key Words

YOUNG DRIVER, CRASH ANALYSIS, DAY, NIGHT, CAR DRIVER

Notes

- (1) PORS reports are disseminated in the interest of information exchange
(2) The view expressed are those of the author(s) and do not necessarily represent those of the Commonwealth Government.
(3) The Federal Office of Road Safety publishes four series of research reports:
(a) reports generated as a result of research done within PORS are published in the OR series
(b) reports of research conducted by other organizations on behalf of PORS are published in the CR series
(c) reports based on analyses of PORS' statistical databases are published in the SR series
(d) minor reports of research conducted by other organizations on behalf of PORS are published in the MR series

1 CHARACTERISTICS OF YOUNG DRIVER CRASHES - MASS CRASH DATA ANALYSIS

1.1 INTRODUCTION

The Monash University Accident Research Centre was commissioned by the Federal Office of Road Safety to undertake the Young Driver Research Program as part of the Federal Government's Road Safety Initiative.

One of the research projects in the Young Driver Research Program involved identifying the characteristics of young driver crashes through supplementing previous literature reviews which identify the known characteristics of young driver crashes, behaviour and performance from experimental, field and evaluation studies.

In addition, this project involved deriving information from a systematic analysis of Australian and US mass crash data to complement information from the literature review. The results of this analysis are presented in a series of reports which are outlined below:

Australian data

Report №	Data File	State	Year(s)
1	Casualty crash	New South Wales	1986-1990
	"	Victoria	1984-1989
2	"	South Australia	1986-1990
3	FORS Fatality	New South Wales	1988
4	"	Victoria	"
5	"	South Australia	"
6	"	NSW, Victoria and SA combined	"

USA data

Report №	Data File	US Region	Year(s)
7	GES	North-west	1989
8	"	Mid-west	"
9	"	West	"
10	"	South	"

Overview report

Report №	
11	Reviews the main findings presented in Report Nos 1 to 10

The tables presented in the first report are accompanied by a discussion of results highlighting the main findings contained in that report, as well as noting some of the difficulties inherent in analysis of large data sets. Reports 2 to 10 contain results presented in tabular form only, although a brief description of the data used is given. Report № 11 contains an overview of results comprising two sections: the first notes similarities and differences in results between States and compared to the US data; the second compares results with the main literature findings (see Macdonald; 1994a and 1994b).

This report (No 2 in the series) presents results for South Australian casualty crashes during the years 1986 to 1990, and outlines, in turn:

- the role of mass crash data in identifying problem areas for young driver safety
- the data set used in the study
- the methodology used
- results:
 - general bivariate patterns
 - daytime vs night-time young driver crashes

This study provides a systematic analysis and review of young driver crashes as represented in mass crash data; to date only ad-hoc, fragmented investigations of young driver crashes using mass crash data have been undertaken. This series of reports, therefore, serve as a comprehensive source document on young driver crashes.

1.2 USING MASS CRASH DATA

Mass crash data provide the most complete and readily available details about crash events, in terms of:

- the temporal and spatial details about the crash incident (where and when it occurred)
- driver (and other involved road user) demographics
- environmental conditions when the crash occurred
- the sequence of events preceding the crash (crash types), including the traffic context and vehicle/road user actions.

Due to reporting criteria, these data are also more representative of crashes involving injury (particularly more serious injury) to the road user(s) involved in the crash than of less severe crashes (eg. property damage only crashes).

Information derived from analysis of mass crash data is essential for identifying target areas or 'problems' where countermeasures should be directed. Analysis of mass crash data allows:

- the magnitude of the 'problem' to be ascertained
- the stability of the 'problem' to be determined
- the generality/specificity of the 'problem' to be determined (eg. Are both males and females affected? Does the 'problem' occur at both day and night; in metropolitan and rural locations?).

In using mass crash data to describe the young driver 'problem' and identify target areas, it is important to balance the need to disaggregate the crash problem into homogeneous sub-problems (with similar characteristics), with the number of levels by which the problem is disaggregated. The more homogeneous the sub-problem, the more likely it is that an appropriate countermeasure can be developed that will be effective in reducing that sub-problem; however, in terms of cost-effectiveness, the sub-problem must be sufficiently large for the cost of the countermeasure to be distributed amongst sub-problem members to allow benefits of the countermeasure to, at least, match its costs (Cameron, 1990).

Countermeasures are also more likely to be cost-effective if they target a sub-problem which has a higher than average risk of crash involvement, or of severe injury when involved (Cameron, 1990). The lack of comparable exposure data to determine crash or severity risk of sub-problems compared with average risks, however, means that 'high' risk sub-problems cannot be identified directly in this study.

Information derived from analysis of mass crash data is inherently descriptive in nature; that is, it does not provide information regarding the causal mechanisms or factors leading to a crash occurring. Road user 'errors' or factors causally related to the behaviour and context identified in a crash may only be inferred.

To be successful, a countermeasure must either:

- control and decrease the opportunity for the occurrence of behaviour related to crash problem types via external impositions, or
- 'correct' the causes and behavioural problem related to the critical actions leading to the crash.

Although the former approach has been applied successfully to other road safety problems, it has not led to significant gains in the young driver area. This is because the over-involvement of young drivers in crashes is not limited to a small number of crash types (where each could be addressed by a specific strategy), but is a more general phenomenon (Drummond & Triggs, 1991).

In the case of young driver safety, the latter approach is more likely to lead to more efficient countermeasures (those which provide greater overlap between a behavioural problem and a countermeasure). However, this can only be achieved by obtaining a better understanding of the behavioural problem (a product of the interaction between performance and motivational factors). A better understanding of the driving process, skilled performance and motivational factors is the first step to achieving this. A description of the behavioural problem may lead to effective countermeasures, but these will be generally less efficient.

Notwithstanding the limitations of mass crash data analysis outlined above, the identification of sub-problems by their relative incidence within the population of young driver crashes is an important criterion for selecting targets for cost-beneficial countermeasures and understanding/interpreting other young driver performance findings.

2 SOUTH AUSTRALIAN CASUALTY CRASH FILE (1986-1990) - BIVARIATE ANALYSES

2.1 INTRODUCTION

Data was obtained from the South Australian Department of Transport of reported South Australian crashes for the years 1986 to 1990. Prior to conducting bivariate analyses (age by variable of interest), the data was modified as follows:

- As the focus of primary interest was young *car* drivers, a driver-based file consisting of car and car derivative drivers was created. Included were drivers of cars (sedans and tourers), station wagons, panel vans and utilities.
- Most casualty crash files contain a variable which stipulates the severity of the crash ranging from a fatality to property damage, but this system creates problems in making across state comparisons due to differing reporting requirements for the lower severity levels in each state. Because of this, it has been the practice for this series of reports to only include the three most severe crash levels in the analysis; ie. fatalities, injuries requiring hospitalization (admitted injuries) and injuries not requiring hospitalization (treated injuries). However, the South Australian data does not differentiate injury severity levels: hence both fatal and all injury crashes have been included for the analysis.
- Age of drivers was grouped as follows: 0 to 15, 16 to 25 (16 being the minimum licensing age in South Australia), 26 to 40 years, 41 to 55 years and 56 to 97 years (the latter being the oldest age found in the data). The benefit of this grouping is that there are only four age group categories which facilitates presentation and discussion of results. The term 'young drivers' refers to 16 to 25 year old drivers only.
- All 'not known' cases (eg. not known age group, not known day of week, etc) were collapsed with other missing cases. The proportion of not known or missing data was high for the South Australian data at 24% over the five year sample period.

2.2 TABLES - BIVARIATE ANALYSES

The tables on the following pages present frequencies for each variable of interest distributed by age group for each year in the file. Consistent with the data presented in the first report, the tables have been grouped as follows (page numbers have been included here for the convenience of the reader):

DESCRIPTION OF CRASH	Page
Crash degree	7
Number of units involved	8
Number of unit casualties	10
Number of casualties	12

	Page
WHEN DID THE CRASHES OCCUR?	
Day of week	14
Weekday versus weekend	16
Time period	17
Time period by weekday/weekend	19
WHERE DID THE CRASHES OCCUR?	
Metro/rural	21
Intersection type	22
Speed limit	24
Road feature (alignment of road)	26
Road surface (sealed/unsealed)	27
Traffic controls	28
WHAT WERE THE FACTORS WITHIN THE VEHICLE - DRIVER	
Sex of driver	30
Forensic BAC group	31
Status of licence	32
Years of vehicle driving experience	34
Total driving experience	36
State of licence issue	38
WHAT WERE THE VEHICLE FACTORS?	
Year of vehicle manufacture	40
WHAT WERE THE ENVIRONMENTAL CONDITIONS?	
Natural light	42
Weather	43
Road surface conditions (wet/dry)	44
WHAT OTHER FACTORS SURROUNDED THE CRASH?	
Vehicle movement	45
Crash type	48
Factors/errors	51

3 SOUTH AUSTRALIAN CASUALTY FILE (1986-1990)- DAY/NIGHT COMPARISONS

3.1 INTRODUCTION

Bivariate analyses which showed drivers who were involved in reported casualty crashes in NSW for the years 1986 to 1990 split by age group appeared in an earlier chapter of this report. There are numerous ways in which the data can be analyzed and an important consideration is any age group differences arising as a result of the time of day, given the increased risk of night-time driving relative to driving during the day. The current chapter re-examines the casualty crash data with the following modifications:

- 'day' was operationally defined as the period between 6.00 am and 5.59 pm while 'night' was defined as the period between 6.00 pm and 5.59 am
- the analyses were conducted on the combined years of 1986 to 1989. These years were selected as they were common to the South Australian, New South Wales and Victorian databases and enable the reader to make some direct comparisons between the three states.

3.2 TABLES - DAY/NIGHT COMPARISONS

Variables and page numbers are listed here for the convenience of the reader:

	Page
DESCRIPTION OF CRASH	
Crash degree	58
Number of units involved	59
Number of unit casualties	60
Number of casualties	61
WHEN DID THE CRASHES OCCUR?	
Day of week	62
Weekday versus weekend	63
Time period	64
Time period by weekday/weekend	65
WHERE DID THE CRASHES OCCUR?	
Metro/rural	66
Intersection type	67
Speed limit	68
Road feature (alignment of road)	69
Road surface (sealed/unsealed)	70
Traffic controls	71

	Page
WHAT WERE THE FACTORS WITHIN THE VEHICLE - DRIVER	
Sex of driver	72
Forensic BAC group	73
Status of licence	74
Years of vehicle driving experience	75
Total driving experience	76
State of licence issue	77
WHAT WERE THE VEHICLE FACTORS?	
Year of vehicle manufacture	78
WHAT WERE THE ENVIRONMENTAL CONDITIONS?	
Natural light	79
Weather	80
Road surface conditions (wet/dry)	81
WHAT OTHER FACTORS SURROUNDED THE CRASH?	
Vehicle movement	82
Crash type	83
Factors/errors	84
