

Good afternoon all ,

Thank you for the opportunity to comment . My Company has over 40 years' experience in installations of MATV Systems ,mainly in the mining Industry to accommodation villages ,requiring all cable networks in construction , underground ,and remote sites , as well as satellite Broadband .

The Mining industry including Australia's biggest companies ,to this day , have not learned that taking short cuts to save money has always been the most expensive option , after doing it all again sometime down the track !
If you must string link cables across power poles ,forget about coaxial cable and use fibre !

Recent major projects taken on by IT companies in the mine industry ,have all failed due to the fact that IT personnel do not understand Television .

There are better ways to save costs in the satellite broadband project also –
But you are not asking the question now !

Regards,

COLE BAILEY
